

Planning of Biogas Plants

A conscientious planning guarantees the profitable operation of your biogas plant

Anselm J. Gleixner, Managing Partner of INNOVAS GbR

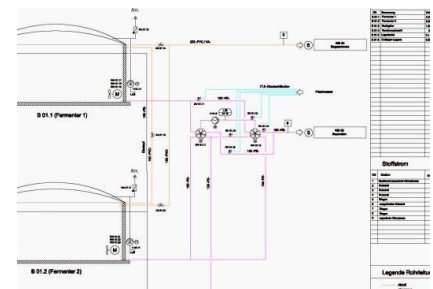

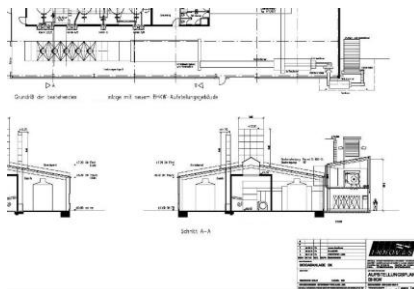

In the beginning is the idea. The implementation of the idea is an **entrepreneurial and strategic decision** which should have a detailed and secure basis.

In order for the idea to become a long-term, secure success, conscientious and detailed planning is required right from the start. Anyone who tries to save effort, time and money at this stage should not be surprised if later on it turns out differently than intended.

Planning must be targeted to meet individual needs, and at each stage must take into account the interrelationships between the required technology, economy, legal requirements and site-specific conditions.

With over **25 years of experience in plant engineering**, we are **the competent partner** for a professional and long-term successful implementation of your good idea. We are independent of suppliers and can therefore always plan the most optimal and favorable biogas plant for your application. **Your success is our motivation.**

- We plan according to standards and are in compliance with all applicable laws and regulations. The plant to be planned is calculated and specified for the client's requirements from the beginning. These calculations and specifications are always kept up to date.
- Before the start of planning, we are happy to conduct a sound technical and economic preliminary investigation, with the development of the required system concept. With a technical feasibility study, the customer gets the greatest possible planning security and these costs are credited later in the planning.
- We consistently plan according to the specifications of the HOAI, carry out the approval procedure, whether under construction law or according to the BImSchV, prepare the tender documents and assist with the assignment of the trades. We take care of the project from the construction phase to the successful commissioning of the plant.
- The preparation of complete and extensive plant documentation and an operating manual is obligatory for the biogas plants we plan.
- We not only offer the re-planning of biogas plants, but also like to plan remodeling and supplementary measures on existing biogas plants.
- We also supplement and revise plant documentation of existing biogas plants. If some documentation is missing, such as risk assessments, explosion protection concepts, ex zone and fire service plans, we help you to complete it.
